

Design Pattern Search

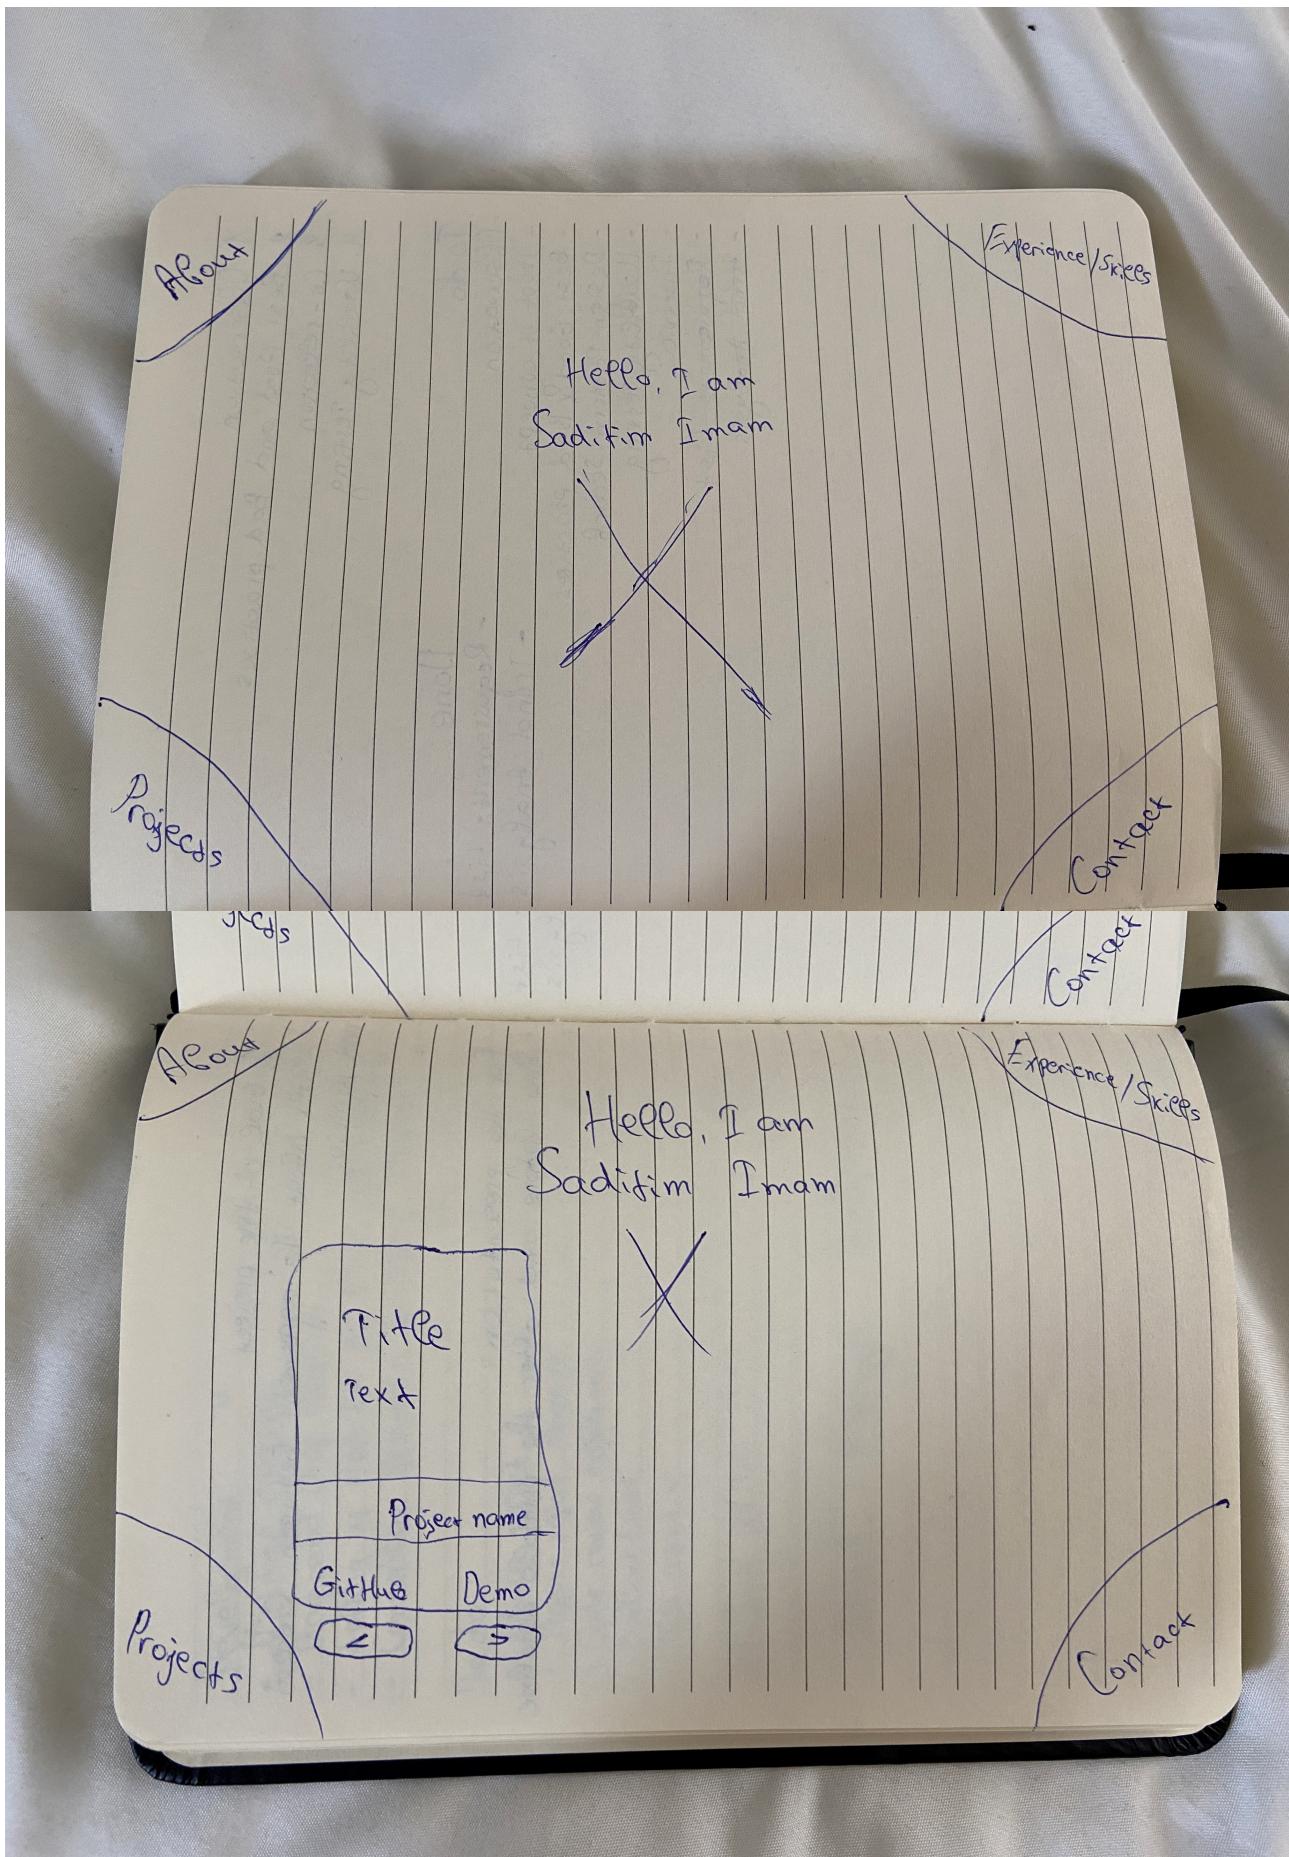

(How does the choice of visuals, layout, and design impact the overall impression of my creative thinking, programming skills and progress?)

I have been researching about what layout, visuals and design should fit the best for my portfolio. I checked different portfolios in the Internet to take some ideas and implement it in mine.

Here are some of the examples I took a look into and liked. From all the examples I checked, I came to the conclusion that all of the creators tried to keep it as simple as possible, so I am

planning to make mine simple and friendly-user as well. I was inspired to make sketch prototype from the Trent analysis and I can see that most of it uses black and white layout with some creative visuals. I am planning to create a navigation bar in a creative way. Every tab will be on the corners of the display. For example, the project tab could be on top left, since this is the most important page of the portfolio and proven people first see from left to right. Then experience or skills on top right, about me on bottom left and contact on bottom right.

This is an example of my current idea, after the research I have made and the ideas I took from other portfolios
